Tab 12 — Multicollinearity / VIF

VIF (Variance Inflation Factor) measures how much a feature is explained by others. $VIF > 10$ = severe multicollinearity → consider dropping or combining.

Sensor vs GT Correlation (Redundancy Check)

PT08.S1(CO) ↔ CO(GT) : $r = 0.7769$

PT08.S3(NOx) ↔ NOx(GT) : $r = -0.5724$

PT08.S4(NO2) ↔ NO2(GT) : $r = 0.1400$

Sensor readings (PT08.Sx) are highly correlated with GT columns — expected by design.

⚠ For ML models, consider using EITHER sensor OR GT columns as features, not both, to avoid multicollinearity inflating model coefficients.

✅ Weather features (T, RH, AH) have moderate VIF — acceptable to keep all three.
